

Dashboard & Alerts Guide

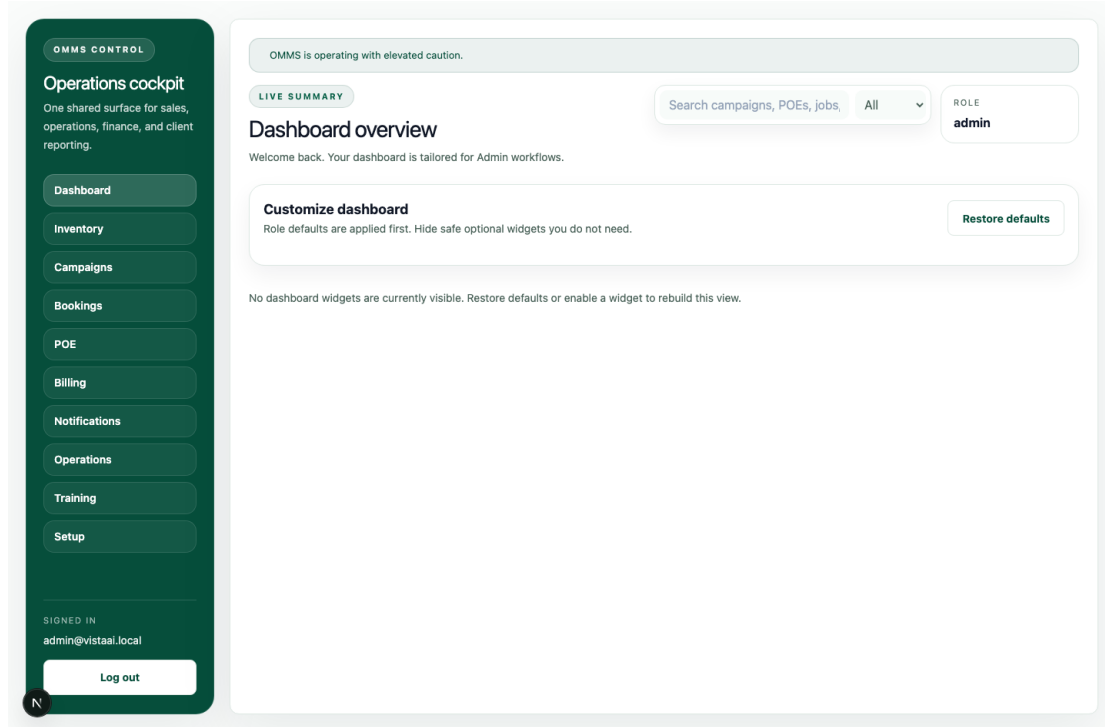

Guide to role dashboards, live Operations, alert severity, acknowledgement, cooldowns, saved views, search, and system status.

Audience	Admins, owners, operations, and finance leads
Updated	May 20, 2026
System	OMMS Outdoor Media Management System

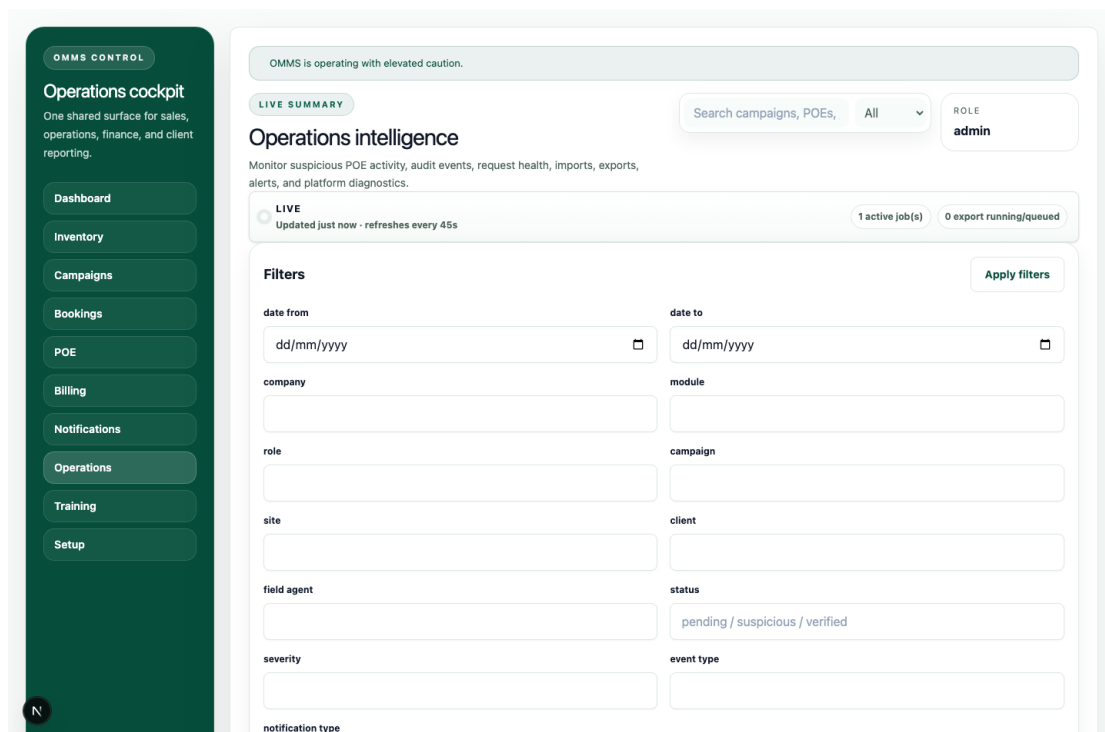

This guide reflects the current OMMS SaaS web platform and mobile operations companion: white and forest green UI, operational intelligence, role dashboards, alerts, imports/exports, POE review, billing risk, and system diagnostics.

How to use this guide

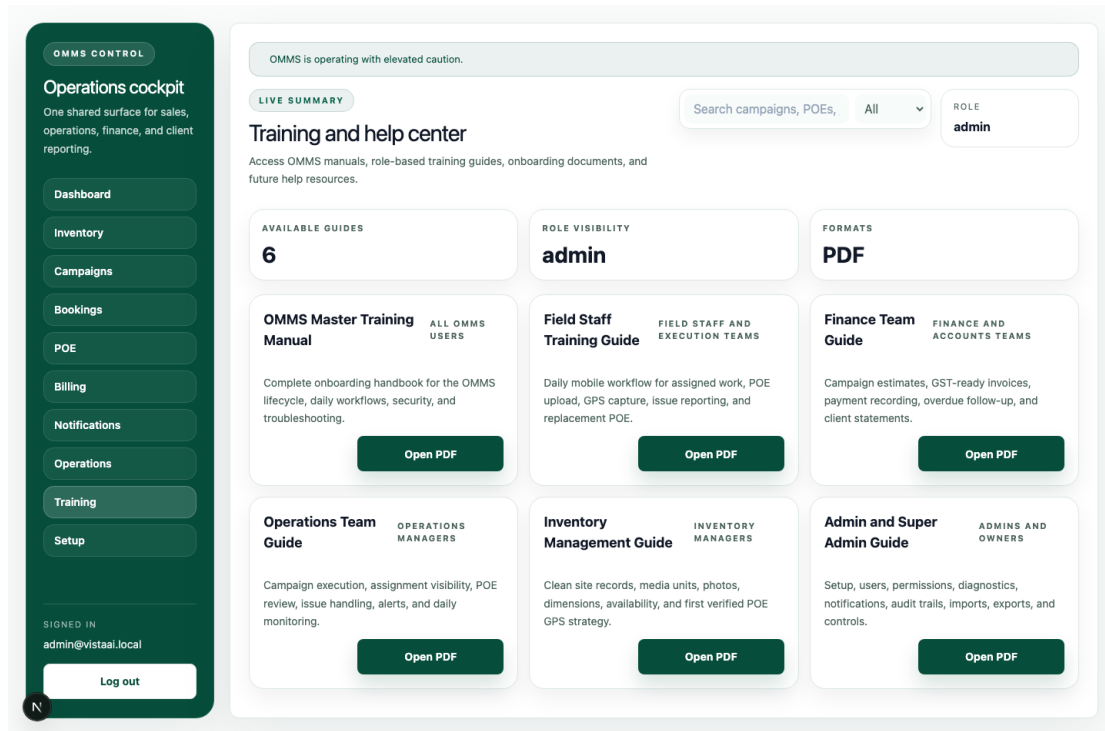

Use the screenshots as orientation, then follow the workflow sections in order. OMMS is role-aware, so users may see a smaller dashboard than the admin examples shown here.

Role-based dashboard with compact business and operations widgets.

Live Operations dashboard with search, filters, alerts, diagnostics, and activity.

Training Center access to controlled reference material.

Live operations layer

Operations refreshes key data without requiring a page reload. Live indicators show updated time, active jobs, export activity, alerts, and system status calmly.

Widget-level failures are contained so one unavailable feed does not hide the full dashboard.

Alerts and saved views

- Use alert severity to prioritize admin attention.
- Acknowledge alerts when responsibility is accepted.
- Cooldowns prevent duplicate alert spam.
- Save recurring views such as Critical Campaigns, Pending POEs, Failed Imports, or Finance Risk.

System status

System Status reports API, database, Redis/Celery readiness, failed requests, slow requests, failed jobs, last import/export, deployment environment, and maintenance mode without exposing secrets.

Operational checklist

- Review critical alerts before normal dashboard widgets.
- Use saved views for repeated daily operating reviews.
- Treat degraded system health as an admin follow-up item.
- Keep role dashboard widgets aligned with each user's responsibilities.
